Title: System, Method and Computer Program Product for Authenticating Users Using a Lightweight Directory Access Protocol (LDAP)

Directory Server

IN THE SPECIFICATION

The paragraph beginning at page 4, line 4 is amended as follows:

Today, a new protocol, lightweight directory access protocol (LDAP), is gaining wide acceptance in business. The LDAP standard defines an information model for a directory, a namespace for defining how directory information is referenced and organized, and a network protocol for accessing information in the directory. LDAP can also include an application programming interface (API). The LDAP protocol mandates how client and server computers can communicate with a LDAP directory. However, LDAP does not mandate how data should be stored. LDAP directories are described in greater detail in "Introduction to Directories and the Lightweight Directory Access Protocol," available at http://www.stanford.edu/hodges/talks/mactivity.1dap.97/index2.html. More and more companies today use an LDAP directory server to store a database of employees. The LDAP directory generally can store an employee name, phone number, address and other information about the employee, and a password for modifying the employee's information.
